Tarpon Construction Management (TCM) was contracted by an international design and consulting firm to perform major electrical and instrumentation construction on a Potash mine located in Saskatchewan. Owned by a global resources company, the mine consists of three components: Base Building, East and West Hoist Houses and the North Electrical Room.

Our turnkey scope included the installation of:

- MCCs
- Transformers
- Panelboards
- Lighting
- Cable Tray
- Teck Cables
- Electric Heaters
- Receptacles
- Grounding
- Fire Alarm
- Crane and Overhead Door Connections

TCM installed a state-of-the-art fire alarm system, the first of its kind in North America. The new technology presented several challenges; however, the alarm provider and TCM worked seamlessly as a team and were successful with the installation of the advanced fire alarm system.
